INTRODUCTION

The information contained in this manual will allow you to install your Rytec Spiral® LH Door in a manner which will ensure maximum life and trouble-free operation.

Any unauthorized changes in procedure, or failure to follow the steps as outlined in this manual, will automatically void the warranty. Any changes in the working parts, assemblies, or specifications as written that are not authorized by Rytec Corporation will also cancel the warranty. The responsibility for the successful operation and performance of this door lies with the owner of the door.

DO NOT OPERATE OR PERFORM MAINTENANCE ON THIS DOOR UNTIL YOU READ AND UNDERSTAND THE INSTRUCTIONS CONTAINED IN THIS MANUAL.

If you have any questions contact your Rytec representative or call the Rytec Technical Support Department at 800-628-1909. Always refer to the serial number of the door when calling the representative or Technical Support.

The wiring connections and schematics in this manual are for general information purposes only. A wiring schematic is provided with each individual door specifically covering the control panel and electrical components of that door. That schematic was shipped inside the cover of the System 4 control panel.

HOW TO USE MANUAL

Throughout this manual, the following key words are used to alert the reader of potentially hazardous situations, or situations where additional information to successfully perform the procedure is presented:

⚠️ WARNING

WARNING is used to indicate the potential for personal injury, if the procedure is not performed as described.

⚠️ CAUTION

CAUTION is used to indicate the potential for damage to the product or property damage, if the procedure is not followed as described.

IMPORTANT: IMPORTANT is used to relay information CRITICAL to the successful completion of the procedure.

NOTE: NOTE is used to provide additional information to aid in the performance of the procedure or operation of the door, but not necessarily safety related.

DOOR SERIAL NUMBER(S)

To obtain your DOOR SERIAL NUMBER, there are three universal locations that this information can be attained. These are on the left side column (at approximately eye level), on the non-drive side head console assembly, and inside the door of the System 4 control panel. (See Figure 1)

IMPORTANT: When installing multiple doors of the same model, verify & match the serial numbers of all the components for each door (i.e. control panel, side columns, head assembly, etc.). Identify & mark any items that may not have a serial number label before taking out of the shipping container (right side column assembly for instance).

NOTE: The following illustration shows the front side of the door. Left and right are determined when viewing the front side of the door.

---

*Figure 1*
INSTALLATION-MATERIAL, TOOLS, AND EQUIPMENT

INSTALLATION

MATERIAL, TOOLS, AND EQUIPMENT

1. Threaded rod (Ø½-inch) and other various wall anchor hardware and material. Concrete. Anchor bolts (Ø½-inch). (See “ANCHORING METHODS” on page 3)
2. Assorted shim stock. (See Figure 11, Figure 12, Figure 13, & Figure 15)
3. Double-sided tape.
4. Package of oversize plastic cable ties.
5. Mounting hardware for field-installed brackets.
6. Carpenters or spirit level (4-ft. minimum length).
7. Carpenter's square.
8. Fish tape.
10. Masonry drill bit (for Ø½-in. anchors).
11. Three or four bar clamps (18-in. long).
12. Hammer or mallet and blocks of wood.
13. Crowbar or pry bar.
14. Assorted hand tools (pliers, tape measure, etc.).
15. Plumb bob with line.
18. Water level, line level, laser level, or transit.
19. Two ladders (taller than height of door opening).
20. Forklift (see “Forklift Requirements” on page 2).

ADDITIONAL REQUIREMENTS

Labor and Site Requirements

1. Two installers.
2. A licensed electrician is required for making all electrical connections. (See “Electrician’s Responsibilities”.)

NOTE: All electrical work must be performed in accordance with local, state, and all applicable building codes.
3. 100% accessibility to the door opening during the entire installation process. No traffic should be allowed to pass through the opening while the door is being installed.

Forklift Requirements

A forklift supplied by the customer, dealer, or installer is mandatory for the safe and proper installation of this door. The forklift should have:
- 4,000-pound lift capacity.
- minimum height ability — door height plus 12 in.
- 48-in. wide fork
- side-shift capability (desired).

Electrician’s Responsibilities

For complete details on the responsibilities of the electrician, refer to the Rytec System 4 Drive & Control Installation & Owner’s Manual.

NOTE: See “CONTROL SYSTEM” on page 27 for complete details on the electrical work to be performed.

1. Install fused disconnect and Rytec control panel. (See Figure 2 for typical installation.)
2. Install all necessary conduit tubing.

NOTE: Separate conduit must be run for high & low voltage wiring.
3. Run electrical power lines to disconnect.
4. Run power lines from disconnect to control panel.
5. Run power lines from control panel to upper junction box.
6. Run power lines from control panel to door motor.
7. Run low-voltage cables from door to control panel.
8. Mount rear photo eyes as necessary (for older version doors & additional optional PE’s).
9. Wire low-voltage safety devices and activators (if used).

Floor-Loop Activator Requirements (If Used)

If a floor-loop activator was ordered & shipped with your Rytec door, the following additional items are required to install the activator:

NOTE: Complete floor-loop installation instructions are shipped with the activator.

1. Concrete saw (with water-cooling attachment).
2. Water supply and garden hose.
3. Wet/dry shop vacuum.
4. 200–500 ft. of 16-gauge, 19-strand, type XLPE, copper, crosslink polyethylene jacket wire (or equivalent). The size of the floor loop will determine the length of wire required.

5. Bondo P606 Flexible Embedding Sealer (or equivalent) - required to fill saw cuts in floor after the activator is installed. For cold temperature applications, Bondo P610 Speed Set must be added to the P606 to ensure the sealer cures properly.

GENERAL ARRANGEMENT OF DOOR COMPONENTS

Figure 2 shows the location of the major components of your Spiral LH door. This illustration should be used as reference only and should not be considered as part of the installation instructions.

NOTE: The above illustration shows the front side of the door. Left and right are determined when viewing the front side of the door.

ANCHORING METHOD

Correct anchoring of the side columns to the wall and floor is important for the smooth and safe operation of the door. The wall material should be strong enough to support the weight of the door and all wall anchors.

Figure 3 details the wall load requirement for supporting the Rytec Spiral LH door. Figure 3 through Figure 5 show anchoring methods for various types of walls. Use the method best suited for your particular installation site.

All necessary anchoring hardware and material for the installation of this door is the responsibility of the door owner. If you have any questions, call your Rytec representative or the Rytec Technical Support Department at 800-628-1909.

NOTE: Use Ø½-in. threaded through bolts or Ø½-in. threaded rods to anchor the door to all wall applications. Use Ø½-in. concrete anchor bolts to anchor the door to a concrete floor.

Concrete, Block, or Brick Walls

Concrete, Block, Brick or Wood Wall

Insulated Wall
UNCRATING

NOTE: Remove parts and sub-assemblies from the shipping crate in the order directed throughout this manual.

1. Remove the two side column assemblies, spring pack assemblies, and the small parts carton from the shipping crate. (See Figure 6)

DOOR OPENING CENTERLINE LOCATION

NOTE: Accurate measurements are critical for the proper installation and operation of your Rytec door. Verify all measurements.

1. Measure the width of the door opening. Then divide the measurement in half to locate the centerline. Mark the centerline along the floor. (See Figure 7)

LOCATING SIDE COLUMNS

1. Locate the object list for the door. It should be located in the small parts carton. This List identifies the production width & other important information for your door. (See Figure 29)

2. Using the centerline as a reference point, lay out and mark half of the door’s production width along the floor. (See Figure 8)

3. With a carpenter’s square placed against the wall, mark both sides of the door along the floor. Extend the line along each edge.

4. Check that the floor is level across the door opening. The floor must be level within 0.12 in. (3 mm) from side to side. If one side of the opening is higher than the other, a shim will be required under the side column.

Figure 9 and Figure 10 show two recommended methods that can be used to ensure a level side column installation.

NOTE: Contact the Rytec Technical Support Department if the floor is more than 1 in. out of level.
5. Use a plumb bob, laser level, or carpenter’s level to check the wall for plumb in the areas where the side columns are to be mounted. Also, inspect the wall for any obstructions. If the wall is not plumb, use shims. If you find an obstruction, remove it, or shim the column to avoid the obstruction. (See Figure 11)
USING A PLUMB BOB

To check for plumb measure a few inches away from the face of the side column near the top (Dimension A) and lower the plumb bob as shown. (See Figure 12)

Mark the floor where the plumb bob touches. Compare the upper measurement to the lower measurement. Shim the column toward or away from the wall, as required, until the two measurements are equal and the column is plumb to the wall. (See Figure 13)

Also, measure a few inches away from the side of the column near the top (Dimension B) and lower the plum bob. (See Figure 12) Mark the floor where the plumb bob touches. Compare the upper measurement to the lower measurement. Lean the column to the left or the right until the two measurements are equal and the column is plumb with the floor (or shim plate).

USING A CARPENTER’S LEVEL

Hold the level firmly against the face and side of the column. Make the necessary adjustments to set the side column level.

4. Temporarily clamp the side column to the wall once the column is properly positioned.

5. Using the predrilled anchor points in the back of the column as a reference, mark their location on the wall. (See Figure 14)

**WARNING**

Before drilling any holes, ensure there are no electrical wires, water pipes, or gas lines, etc., buried in the floor or hidden in the wall.

**IMPORTANT:** Locate and drill the holes in the center of each slot and hole.

6. Using the predrilled anchor points in the base plate as a reference, mark their location on the floor. (See Figure 15)
Before drilling any holes, ensure there are no electrical wires, water pipes, or gas lines, etc., buried in the floor or hidden in the wall.

**IMPORTANT:** Locate and drill the holes in the center of each slot and hole.

7. Unclamp and set the column aside. Drill holes into the floor and through the wall for all anchors.

8. Reposition and re-clamp the side column to the wall. Secure the base plate to the floor with the appropriate anchors. Do not over-tighten the anchors at this time.

9. Anchor the side column to the wall using the appropriate anchors (see “ANCHORING METHOD” on page 3) and all drilled anchor points. Do not fully tighten the anchors at this time. They should just be snug.

10. Check for plumb and level. Reposition the side column to the wall if needed.

11. Mount the remaining side column to the floor and wall in the same manner as outlined for the previous side column.

**NOTE:** To ensure the side columns are positioned identically, take measurements for each column from similar points of reference.

12. With both columns set and snugly bolted in place, check the overall plumb, level, and square of the mounted columns. (See Figure 16)

Compare the diagonal measurements and the upper and lower horizontal measurements across the columns. The columns are square and parallel when the diagonal measurements are equal and the horizontal measurements are equal.

If either column requires a slight repositioning (when the difference of either comparison is greater than ¼ in.), use a block of wood and a mallet to move the column into position.

13. Double-check all measurements. Then firmly tighten all floor and wall anchors.

**REAR SPREADER**

To make it possible to install the spreader bar, and the head console assemblies later on, the door track running along the inside edge of each side column must first be released and slid out of the way.

1. Each section of door track is attached to the side column by a series of aluminum clips that are bolted to the back of the side column. Loosen the hex nut that locks each clip in place. (See Figure 17)

2. Once each clip is loose, slide the door track to the bottom of the side column.

3. With the curved side of the spreader bar facing away from the wall, attach the ends of the spreader to the side columns. Use two M8 – 1.25 x 20 hex flanged head screws & washers at each end. The screws are located in the small parts carton. (See Figure 18)
4. Using the appropriate hardware, secure the spreader bar to the wall at the two anchor points in the center of the spreader as shown. The rear spreader must be secured to the wall at all anchor points. (See Figure 18)

**NOTE:** When securing the spreader to the wall, it will be necessary for you to mark the location of the wall anchors using the spreader holes as a reference. After drilling the required holes and installing the anchors, permanently secure the spreader bar to the wall.

Additionally, if shims or spacers were installed behind the side columns, it will be necessary for you to shim behind the spreader to match the side columns.

5. Tighten all hardware in the side columns and rear spreader. Check the alignment of the side columns and rear spreader with a level. Adjust as necessary.

---

**CONSOLE ASSEMBLY**

**WARNING**

**DO NOT** lift the console assembly without clamping or securing it to the forklift. Failure to securely fasten the console assembly to the forklift can result in property damage and/or personal injury.

**NOTE:** The console assembly is extremely heavy. The use of a mechanical lift is required if the ceiling height is too low to allow the use of a forklift for installing the console assembly.

1. Carefully lift and remove the console assembly from the shipping crate. (See Figure 19)

2. Before lifting the console assembly into position, remove all console covers. Retain all fasteners. (See Figure 20)
3. Remove cap screws on both consoles. Retain the fasteners to use for the installation of the console to the side columns. (See Figure 21 and Figure 22)

4. Raise and position the console assembly above each side column so that it is parallel to the wall and level with each side column. Align the console assembly with the side column and install the five cap screws that were removed in step 3. (See Figure 23 and Figure 24)

   NOTE: Use extreme care when lowering the console assembly into position.

5. Secure the console assemblies to the wall with the provided anchors. (See Figure 25)

6. Remove the guide wheel track cover. Loosen the hardware to the retaining clips and lower the track assembly. (See Figure 26)

   NOTE: Depending on the height of the door, the track cover may be a one or two piece unit. If it is a two piece unit, the top half of the track cover should be removed as shown in Figure 26.
NOTE: Spacers are used to ensure a gap between the back of the column and the guide rail track. Be sure that the spacers have not fallen to the bottom of the side column. Should they fall out of position, make sure they are spaced between mounting bolts.

7. Insert the two guide pins into the top half of the front track cover. (See Figure 26)

8. Insert the two guide pins into the rear holes in the console assembly guide rails. (See Figure 27)

9. Slide each length of straight track assembly up against the spiral guide rail tracks as shown. To secure the track in the side column, lock the retaining clips to the track by threading the flanged hex nuts tight against the retaining clips. (See Figure 26 & Figure 28)

NOTE: Lubricate the pins to ease installation
SAMPLE OBJECT LIST

Included with every door shipped is an Object List as shown in Figure 29 which is a sample version. This list contains key information specific to the door such as the model, serial number, door Production Size specifications, etc. Locate this document (it will be with the small parts for the door) as you will need information on it which will be crucial for proper installation, operation, and maintenance. Keep this document along with the manuals in a safe place for future reference.

**Configuration**

- **Door Model Name**: Spiral Low Headroom "S"
- **Door Width (Inches)**: 214.961
- **Door Height (Inches)**: 99.213
- **Production Width in mm**: 5,460
- **Production Height in mm**: 2,520
- **Line Voltage**: 208V
- **Motor Mount Side**: Left Hand Motor
- **Motor Duty**: Standard Duty Motor
- **Horsepower**: 2.0
- **Number of Solid Slats**: 15
- **Number of Windows**: 0
- **Number of Vent Slats**: 0
- **Brake Release Location**: Release lever on side column
- **Number of Springs**: 6
- **Spring Tension (in)**: 3.583
- **LH Inner Spring Pack Qty**: 0
- **LH Outer Spring Pack Qty**: 3
- **RH Outer Spring Pack Qty**: 3
- **RH Inner Spring Pack Qty**: 0
- **Spring Tension in mm**: 91
- **Number of Pre-Wraps**: 2.300

**Figure 29**
INSTALLATION-CONNECTION SHAFT

CONNECTION SHAFT

NOTE: Check that all side columns, rear spreader, and console assemblies are properly anchored and that hardware is tightened prior to installation.

The following procedure may be used with either console assembly as a starting point.

1. Turn the drive shafts of both consoles until the jaw clamps of the serrated belts arrive at the upper rubber bumper. (See Figure 30) The blue nylon strap has pre-wraps wound onto the drive shafts. The blue straps MUST have pre-wraps and be equal in length on both sides after cutting the cable tie free. The clamping jaws for the drive shaft should also be in the same position when aligned properly. (See Figure 29. The sample object list shows that 2.3 pre-wraps are required for that specific door.)

2. Remove the hardware and the clamping jaw half from the drive shaft. (See Figure 31)

3. Loosen the hardware on the opposite end of the drive shaft but do not remove the clamping jaw half. Insert the end of the connection shaft as shown. (See Figure 32)

4. Insert the opposite end of the connection shaft into the drive shaft and install the clamping jaw half. Provide an equal gap on both ends between the drive shaft and connection shaft. (See Figure 33)

NOTE: For proper belt alignment, the drive shafts should be pushed out as far as possible away from the connecting shaft.

5. On the opposite end. Verify the gap between the drive shaft and connection shaft. Tighten the clamping jaw halves.

6. Insert the serrated belt and blue nylon strap into their respective pulleys.
PRIMARY DRIVE BELT

The primary drive belt must be tensioned. Final tensioning must be carried out with the door closed after it is installed. To do this, measure the low tension side. With a testing force of 22.5 lbf, the deflection of the belt should be 0.393 inches.

NOTE: If the primary drive belt still jumps despite being tightened as above, the depth of deflection can be reduced by 0.078 inches.

If the belt is tensioned too much, the bearing on the connecting shaft or the connecting shaft itself can be affected.

SPRING PACK AND SECONDARY DRIVE BELT

The spring pack mechanism consists of spring assemblies and belts. It balances out the weight of the door panel assembly. This mechanism also assists the drive motor to open the door.

SPRING PACK SYSTEM

Depending on the size of the door, up to six springs are used. Springs are arranged in spring pack assemblies consisting of one, two, or three springs. A nylon strap attached to the upper end of each spring pack connects the pack to the drive shaft located in the console assembly. (See Figure 34)

NOTE: The larger S-size doors may have two straps containing up to a maximum of two spring packs with three springs each.

Two spring packs of three in each side column is the maximum.

1. Locate the blue nylon spring strap on the end of the drive shaft. To lower the strap through the side column, first carefully cut the plastic cable tie securing the strap to the drive assembly. (See Figure 35)

NOTE: Each spring pack has its own dedicated nylon spring strap. The number of pre-wraps are predetermined at the factory for the proper door timing. DO NOT unwind any of the strap from around the drive shaft. Verify the number of wraps using the object list provided with the door. (See Figure 29, on page 11)

2. Hang each spring pack assembly from its associated spring strap. Make sure the nylon straps are not twisted. Use the hardware provided with the spring pack to attach the strap to the pack. (See Figure 36)

NOTE: Spring packs have a special guide bracket for mounting the spring pack to the side column.

3. With the spring packs attached to the straps, mount the spring packs (with guide bracket) to the side column. Two (2) M8 x 12mm button head TORX® socket screws, located in the small parts carton, are used to attach the spring pack to the side column. (See Figure 36)

NOTE: Screw into the guide from outside the side column.
4. Locate the two threaded studs with nuts mounted to the base plate. Check the bottom set of nuts to be sure they are tight and loosen the top set of nuts. (See Figure 37)

5. The Preload dimension will adjust the spring to a preset tension before securing the spring packs to the base plate. That measurement is from the base plate to the forked plate on the spring pack. (See Figure 38)

NOTE: On the end of the adjustment rod is a forked mounting plate. It is used to attach the spring pack to a pair of mounting posts on the base plate. A pair of nuts on each post locks the spring pack to the plate.

SECONDARY DRIVE BELT AND GUIDE PULLEY SYSTEM

The drive belt used to raise & lower the door is installed in each side column. There are differences between the “L” & “S” series doors so assemble accordingly.

Secondary Drive Belt – Side Column Base Plate (L-SERIES)

1. Each L-series secondary drive belt has been factory mounted to a drive pulley & guide pulley. Also, each belt has been packed for shipping inside its respective drive assembly. Carefully cut the plastic cable tie that is temporarily securing the belt to the drive assembly.
Do not re-index either drive belt on the drive shaft. Leave both drive belts on the drive shaft pulley in the position found. Otherwise, the “timing” of the door travel will be affected, which could result in damage to the door.

2. Pass the secondary drive belt & guide pulley down the side column.

3. The nearest pair of mounting studs on the base plate is used for mounting the secondary drive belt guide pulley. Remove the 2 upper nuts from the set of base plate mounting studs to place the belt guide pulley as shown. (See Figure 39)

4. Secure the guide pulley bracket to the base plate using only the back post. Position that end of the pulley as close to the base plate as possible. (See Figure 39)

Depending on the length of the drive belt, the position of the lower nut along the back post can vary. Tighten the upper nut against the pulley bracket to lock the back of the pulley to the base plate.

5. The front post is used to set the tension on the drive belt. Thread the upper nut down against the pulley bracket until the belt is properly tensioned. Tighten the lower nut against the bottom of the pulley to lock in the tension. (See Figure 41)

NOTE: If you find it difficult to reach the front post with the pulley, give the belt some slack by repositioning the pulley bracket on the back post. Also, it is important that the pulley bracket be level (side to side).

If the pulley bracket is too short to reach the baseplate mounting post in the side column, the guide pulley trolley in the console will have to be adjusted. See “Console Guide Pulley Trolley Adjustment” on page 16. After the installation of the baseplate guide pulley bracket, the tension on the guide pulley in the console should be reapplied.

FOR STYLE “L” SERIES DOORS ONLY

6. To make the belt run true, level the guide pulley assembly by installing one bolt and two nuts, which can be found in the small parts carton, on each tab of the guide pulley bracket as shown. (See Figure 40)

CAUTION

Be sure that the guide pulley bracket is level when the door is in operating mode. Damage to the belt or pulley components may occur if the guide pulley bracket is not level.

NOTE: Loosely install hardware & adjust accordingly.

7. Level pulley assembly, as required, and tighten hardware. (See Figure 41)
Secondary Drive Belt – Side Column Base Plate (S-SERIES)

1. Each S-series drive belt has been factory mounted to a drive pulley. Also, each belt has been packed for shipping inside its respective drive assembly. Carefully cut the plastic cable tie that is temporarily securing the belt to the drive assembly.

   ![Image](Figure 41)

   **CAUTION**

   Do not re-index either drive belt on the drive shaft. Leave both drive belts on the drive shaft pulley in the position found. Otherwise, the “timing” of the door travel will be affected, which could result in damage to the door.

2. Pass the belt down the side column.

3. Install the secondary drive belt on the belt guide pulley mounted in the base plate assembly. Remove the snap ring from the side of the shaft as shown. Adjust the guide pulley trolley on the console if necessary per following section. (See Figure 42)

4. Secure the guide pulley bracket to the base plate with the snap ring.

The secondary drive belt tension is controlled with the console guide pulley trolley. Refer to that section for how to perform this adjustment.

CONSOLE GUIDE PULLEY TROLLEY ADJUSTMENT

The drive belt guide pulley trolley within a drive or non-drive console can be adjusted fore and aft. This allows extra slack in the drive belt system if the guide belt pulley in the bottom of a side column cannot be installed. This should not be misunderstood to be the proper procedure in adjusting the drive belt.

**NOTE:** Doors that are 13 ft. x 13 ft. (L-size) and smaller have only one adjusting screw for the trolley. Doors larger than 13 ft. x 13 ft. (S-size) will have two adjusting screws for the trolley.

For consoles that have two adjusting screws, both screws should be adjusted and, when finished, should have contact with the pads on the trolley.

After installation of the baseplate pulley bracket, the tension on the guide pulley in the console should be applied.
Console – Single Adjusting Screw (L-SERIES)

1. Remove the front cover to the non-drive console.
   *NOTE:* On the drive console, there is no panel to remove to access the adjusting screw.

2. Loosen the two nuts on the side of the console. (See Figure 43)

3. Loosen the two TORX® socket button head screws on the bottom of the console. (See Figure 44)

4. Turn cap screws to adjust guide pulley trolley. (See Figure 45)
   *NOTE:* Turn cap screw clockwise to move the trolley toward the wall. Turn cap screw counterclockwise to move the trolley away from the wall or toward the front of the console.

5. When the desired position of the trolley has been achieved, tighten the hardware and reinstall the front cover.

Console – Dual Adjusting Screws (S-SERIES)

1. Remove the front cover to the non-drive console.
   *NOTE:* On the drive console, there is no panel to remove to access the adjusting screw. The belt cover needs to be removed to access the bolts for the guide pulley trolley.

2. Loosen the two nuts on the side of the console. (See Figure 46)

3. Locate the two holes on the opposite side of the console and loosen the bolts to the guide pulley trolley. (See Figure 47)
   *NOTE:* On the drive console, remove the belt cover to locate the two access holes and loosen the bolts to the guide pulley trolley. (See Figure 48)
4. Turn the cap screws and adjust the guide pulley trolley.

**NOTE:** Turn cap screw clockwise to move the trolley toward the wall. Turn cap screw counterclockwise to move the trolley away from the wall or toward the front of the console.

5. When the desired position of the trolley has been achieved, tighten the hardware and reinstall the front cover.

**HORIZONTAL GUIDE RAILS**

**NOTE:** The door comes from the factory with a set of brackets designed for multi-platform installation. Should the factory brackets be unsuitable for the application, the installer will be responsible for custom fabrication of brackets based on the requirements of the installation.

1. Confirm that guide pins are installed in the horizontal guide rail. (See Figure 49)

2. Insert the horizontal guide rail into the console. Install the hardware and secure the rail to the console. (See Figure 50)

**IMPORTANT:** When installing hardware, make sure the head of the bolt is inside the guide rail, or interference may cause damage to the rollers when the door operates.

**NOTE:** Support the opposite end if the guide rail while performing this installation.

3. Support the end of the guide rail with rope or a mechanical device. Place a carpenter’s level on top of the guide rail and secure the guide rail in a level position. (See Figure 51)
4. Install the ceiling mounting brackets. (See Figure 52)

   **NOTE:** The horizontal guide rail has factory pre-drilled holes for mounting the ceiling brackets, two for each side. Custom fabrication of the brackets and drilling of extra mounting holes may be required to facilitate installation.

5. Install the connecting bracket to both horizontal guide rails. (See Figure 53)

6. Install the rear mounting rail and ceiling mounting bracket. (See Figure 54)

7. Confirm that the horizontal guide rails are still level and all hardware is tight and secure.

8. Check that the overhead rail assembly is square and in proper alignment. (See “FINAL ADJUSTMENTS” on page 31)

**DOOR PANEL**

**CAUTION**

The door panel assembly is extremely heavy. To prevent personal injury or damage to the door panel, the use of a mechanical lifting device or forklift is required for installation.

1. Prior to installation, confirm that the side columns, rear spreader, consoles, connection shaft, and horizontal guide rails are secure and hardware is tightened.

2. The upper track cover section should still be removed from previous steps. (See Figure 55)

   **NOTE:** Depending on the height of the door, the track cover may be a one or two piece unit. If it is a two piece unit, the top half-track cover should be removed as shown in Figure 55.
3. Remove door panel assembly from the crate using the shipping pallet that the panel is strapped to and make a general inspection of the door panel. (See Figure 56)

4. Center the door panel assembly on the forks and align the panel in the center of the opening.

5. Position the pallet and panel on the forks so that the door lip is facing the side column guide rails. (See Figure 57)

6. Guide the rollers of the door into the guide rail system. (See Figure 58)

**NOTE:** The use of a rope might be required to secure the door while trying to insert rollers into the rail system. The rope must be tied to both ends of the door panel. Run the ropes over the connecting shaft and pull the door panel into the guide rails. (See Figure 59)
7. Secure the door panel to the rear mounting rail and install the upper half of the track cover.

**BRAKE RELEASE**

This Rytec door is equipped with a brake override system that allows the door to be manually opened or closed in the event of an emergency or power outage. A steel cable links the electrical brake mechanism, located just above the drive motor, to a brake release handle mounted on the drive side column. The brake release handle is typically mounted on the side column but can also be mounted remotely or just remotely (on the opposite side of the wall).

When the brake release has been engaged, a properly installed door should automatically lift to about 1/3 to 1/2 open.

**Side Column Mounted**

The side column mounted brake release is mounted on the front side column on the door’s drive side.

1. One end of the steel cable was connected to the brake mechanism at the factory. For shipping, the other end has been routed out through the side of the drive console. Pull the cable back through the console assembly and route it down through the side column to the brake release handle. (See Figure 60 and Figure 61)

   **NOTE:** Tug on the free end of the cable to check that it is not caught or hung up.

2. With the brake release handle fully extended out or at 90 degrees, feed the cable through the eyelet in the bottom of the handle. Slide a crimp nut over the end of the cable with the nut tight against the eyelet. Then tighten down the set screw – with most of the slack removed from the cable. The crimp nut is located in the small parts carton. (See Figure 61)

3. Pull the handle several times to stretch the cable and remove any slack. Check the action of the lever on the brake mechanism for proper travel. If necessary, reposition the crimp nut.

   **NOTE:** Be sure that the cable isn’t so tight that the brake mechanism cannot re-engage once the lever is released and put back in place.

4. Cut the cable to length, 2 in. after the crimp nut.

5. Disengage the electric brake by pulling the brake release handle. Then manually lower the door a few inches to verify that the door is not bound or caught up in the head assembly.

6. To re-engage the electric brake to lock the door in place, place the brake release handle back against the side column.
Remote Mounted

The remote mounted brake release is mounted on the opposite side of the wall that the door is mounted on. The cable is routed through the wall & connected to the motor’s brake release. This feature can be used in combination with or in place of the side column mounted brake release.

1. One end of the steel cable was connected to the brake mechanism at the factory. For shipping, the other end has been routed out through the side of the drive console. Securely route the brake release cable down the wall along the side column to about 12” above where the front mount brake release is or would be located. (See Figure 62)

2. Using the front brake release or it’s mounting holes located on the front of the side column as a placement guide for mounting the remote brake release, drill at least a Ø3/8” hole through the wall to the opposite side just above it. Route the cable through the wall to the opposite side. (See Figure 62)

3. Finish routing the cable through to the brake release handle. Mount the brake release. (See Figure 62)

NOTE: Tug on the free end of the cable to check that it is not caught or hung up.

4. With the brake release handle fully extended out or at 90 degrees, feed the cable through the eyelet in the bottom of the handle. Slide a crimp nut over the end of the cable with the nut tight against the eyelet. Then tighten down the set screw – with most of the slack removed from the cable. The crimp nut is located in the small parts carton. (See Figure 61)

5. Pull the handle several times to stretch the cable and remove any slack. Check the action of the lever on the brake mechanism for proper travel. If necessary, reposition the crimp nut.

NOTE: Be sure that the cable isn’t so tight that the brake mechanism cannot re-engage once the lever is released and put back in place.

6. Cut the cable to length, 2 in. after the crimp nut.

7. Disengage the electric brake by pulling the brake release handle. Then manually lower the door a few inches to verify that the door is not bound or caught up in the head assembly.

8. To re-engage the electric brake to lock the door in place, place the brake release handle back against the side column.

DOOR PANEL TO DRIVE BELT L-SIZE

The following procedure can be performed without either the power or the control panel connected as explained below. Should the panel be fully operational, set the System 4 in “JOG MODE” (Refer to System 4 Drive & Control Installation & Owner’s Manual) and lower the belt accordingly.

1. Release the brake to the drive motor assembly.

2. Pull on the drive belt and align the splice block with the door bracket.

3. Install hardware, connecting the door bracket to the splice block in each side column. (See Figure 63)
NOTE: The end bracket and splice block will have a similar configuration.

4. Engage the brake and remove the ropes holding the panel.

DOOR PANEL TO DRIVE BELT S-SIZE

1. Cut the cable tie holding the belt in the consoles.
2. Drop the belt down the side in each side column.
3. At the bottom of the S-size doors the pulley is incorporated into the base plate. (See Figure 64)

4. Remove one of the snap rings from the end of the pulley shaft.
5. Push the shaft through the center of the pulley and remove the pulley. (See Figure 65)

6. Place the pulley inside the loop of the belt & re-assemble the pulley hardware in the bottom plate. (See Figure 66)

7. Repeat the process for the opposite side column.

PHOTO EYES

This door uses two sets of photo eyes to monitor the front and back sides of the door. Each set consists of two photo eye modules, a transmitter & receiver. There are front factory-installed photo eyes that are located in the left - front and right – front corners of the door. There are also rear factory-installed photo eyes that are located in the left – rear & right – rear corners of the door side columns. (See Figure 67)
INSTALLATION-PHOTO EYES

Factory – Installed Photo Eyes

1. Locate each factory – installed photo eye module and its required wire cable. (See Figure 68)

2. Each cable has been routed up through a vertical raceway located in the corner of the side column. Locate the free end of each photo eye cable. (See Figure 69)

3. Route the non–motor side photo eye cable(s) straight up into the console assembly, then across the rear spreader to the motor side console. This rear spreader runs between the console assemblies along the top. (See Figure 70)

Check to make sure the cable(s) are lying on top of the rear spreader. Once all wiring is complete, plastic cable ties must be used to secure the cable(s) to the rear spreader.

4. Continue routing these cable(s) through to the motor side console assembly and over to the door console assembly junction box, located behind a panel on the drive side console. (See Figure 71)

   NOTE: Route cable away from all belts and pulleys. Separate high– and low-voltage cables to prevent signal interference.

5. Remove the junction box cover and save the hardware for later use. Then pass the cable through the double-cable cord grip on the side of the junction box. Do not tighten the cord grip at this time. (See Figure 72)

   NOTE: Take note that the two available cord grips are different – one is a single-cable grip, the other a double grip.
6. Route the drive side photo eye cable(s) out the hole near the back of the drive console. This hole is located just above the raceway. (See Figure 73)

7. From the hole, pass the photo eye cable(s) into the drive-side console and over to the door head junction box. (See Figure 74)

NOTE: Make sure to route the wire cable away from all belts and pulleys. Separate high- and low-voltage cables to prevent signal interference.

8. Pass the drive side front photo eye cable through the double-cable cord grip along with the other front photo eye cable. Tighten the cord grip to lock both photo eye cables to the junction box. (See Figure 72)

9. Route the rear set of side column photo eye cables to the control panel.

NOTE: Be sure the path through which the cables are routed hides & protects them from damage. If necessary, run conduit to the console to protect the cables. Note the end of the cable intended for the photo eye. DO NOT connect the photo eye cables to the control panel at this time.

10. Connect the control lines for the front set of side column factory-installed photo eyes to the door head junction box as indicated on the electrical schematic shipped with the System 4 control panel assembly.

WIRELESS ANTENNA BRACKET

The Spiral LH is equipped with a wireless reversing edge. The antenna & cable are packed into the motor side head console with a piece of foam over the antenna quills to protect them from damage. (See Figure 75)

1. Attach the Upper Corner Bracket to the console as shown. (See Figure 75)
NOTE: Right hand drive upper corner bracket assembly is a mirror of the left hand.

3. Pre-assemble the Antenna/Z shaped bracket to the larger wireless bracket as shown. The tan cable MUST exit towards the floor, from the antenna. Use the M4 x 16 mm hex screws & the standard M4 hex nuts to attach as shown. (See Figure 77)

NOTE: Right hand drive antenna bracket assembly is a mirror of the left hand.

4. Attach the wireless antenna assembly to the Upper Corner bracket using the M4 screws provided as shown. (See Figure 78 & Figure 79)

CONTROL SYSTEM

Once the door has been assembled, see the Rytec System 4 Drive & Control Installation & Owner’s Manual for information on control panel installation, electrical connections, and door limit settings.

NOTE: To expedite the installation of this door, it is recommended that the electrical disconnect and control panel be installed prior to installing the door. Review the layout diagram shipped with your door to determine exactly where these major electrical components are to be located.
The control panel and disconnect are typically mounted adjacent to the left side column.

If you have any questions regarding this installation, contact your Rytec representative or the Rytec Technical Support Department at 800-628-1909.

Control Panel Connections

The disconnect must be in the OFF position and properly locked and tagged before performing the following procedure.

**IMPORTANT:** All high and low voltage cables must be installed in separate conduit, cut to length with no excess or loops.

**NOTE:** All wiring and required conduit between the electrical disconnect and the control panel, between the control panel and the small junction box near the drive motor, and between the control panel and the floor, must be supplied by the owner of the door. All wiring and conduit must meet all local and state building codes and requirements. Wires provided with the door have been identified with terminal or contact numbers.

All conduit entering the control panel **MUST** enter from the bottom. **DO NOT** run any conduit into or through either the top or side of the control panel.

Protect the components inside the control panel from metal chips when installing the conduit. Seal the conduit where it enters the control panel – particularly if the conduit is routed from one area to another, where the two areas can have different ambient air temperatures. If the conduit is not sealed properly, condensation can form inside the control panel, which can lead to serious electrical problems.

**WARNING**

All electrical work must be performed by a licensed or certified electrician. All electrical work must be performed in accordance with all local and state building codes and requirements.

**WARNING**

The disconnect must be in the OFF position and properly locked and tagged before performing the following procedure.

**IMPORTANT:** All high and low voltage cables must be installed in separate conduit, cut to length with no excess or loops.

**NOTE:** All wiring and required conduit between the electrical disconnect and the control panel, between the control panel and the small junction box near the drive motor, and between the control panel and the floor, must be supplied by the owner of the door. All wiring and conduit must meet all local and state building codes and requirements. Wires provided with the door have been identified with terminal or contact numbers.

All conduit entering the control panel **MUST** enter from the bottom. **DO NOT** run any conduit into or through either the top or side of the control panel.

Protect the components inside the control panel from metal chips when installing the conduit. Seal the conduit where it enters the control panel – particularly if the conduit is routed from one area to another, where the two areas can have different ambient air temperatures. If the conduit is not sealed properly, condensation can form inside the control panel, which can lead to serious electrical problems.

**CONTROL PANEL CONNECTIONS**

**Drive Motor to Control Panel**

1. Route the drive motor/motor brake power cable, leading from the motor junction box, to the control panel. (See Figure 81)

**NOTE:** To properly ground the outer shield of this cable, terminate the end of the cable to the control panel using the grounded cable clamp provided.

---

**Figure 80**

**Figure 81**
OPERATING CONTROL SYSTEM - MODES OF OPERATION

2. Connect the drive motor power supply lines to the control panel as indicated on the electrical schematic.

3. Connect the motor brake power supply lines to the control panel as indicated on the electrical schematic.

Brake Release Sensor to Control Panel

1. Route the brake release sensor cable, leading from the motor junction box, to the control panel. (See Figure 82)

2. Connect the brake release sensor control lines to the control panel as indicated on the electrical schematic.

NOTE: Separate high & low voltage conduit.

Activators

Rytec recommends setting the limits on the door and operating the door initially without the activators connected. When the limits have been established and the door cycled opened & closed 20 times, then turn OFF the disconnect power and install the activators. Establishing the limits and operating the door allow you to isolate any potential operating issues to the door without the activators connected. Often activators create problems at initial start-up. Connect activators as shown on the schematics provided in the System 4 control panel received with the door.

OPERATING CONTROL SYSTEM

The Spiral LH Door offers high-speed operation with the advantage of providing a secure barrier. All operator inputs and control functions are carried out by the “System 4” drive and control system. (See Figure 81)

MODES OF OPERATION

The door may be operated in 2 ways: Automatically and Manually.

Automatic Mode of Operation

If a momentary contact activator such as a push-button, pull cord, radio, etc., is used to activate the door:

- The door will open when the device is activated.
- A timer, internal to the control system, will start up once the door reaches the full open position.
- When the internal timer clocks out, the door will automatically begin to close.

NOTE: To properly ground the outer shield of this cable, terminate the end of the cable to the control panel using the grounded cable clamp provided.
If a maintained contact activator device such as a floor loop, motion detector, etc., is used to activate the door:

- The door will open and remain open for as long as the device is active.
- Once the device becomes inactive, the internal timer will start up.
- When the internal timer clocks out, the door will automatically begin to close.

In the automatic mode, while the timer is running, at any time the activator device or another activator in the system is enabled, the timer will reset and the door will not be allowed to close until the timer clocks out. It is only when the timer clocks out that the door will begin to close. (To change the timer setting, see the “System 4 Drive & Control” manual)

In summary, in the automatic mode, an externally installed activator device is used to open the door and an internal timer is used to close the door.

**Manual Mode of Operation**

If a momentary contact activator such as a push-button, pull cord, radio control, etc., is used to operate the door:

- The door will open when the device is activated.
- After passing through the door, a similar type of device must be used to close the door.

In summary, in the manual mode, a manually-operated activator is used to open and close the door.

**NOTE:** The System 4 control has separate inputs programmed with or without the use of timers. Any input utilizing a timer can be turned OFF by simply reducing the time to 0 seconds. (See the System 4 Drive & Control” manual)

**INITIAL START-UP**

**NOTE:** Once you have set your door limits during this procedure they are permanently stored.

**CAUTION**

Initial system start-up is only to occur once the door and control panel have been properly installed, wired, and all preliminary door adjustments made. Failure to follow the instructions as outlined in the installation manual that was provided with your door can result in damage to the door upon initial system start-up.

**CAUTION**

When limits are established, the display will prompt you to push the down key and begin the auto-calibration process. 1:500 messages will appear on the display. This is normal and the messages should disappear within 10 complete cycles. Keep hands & equipment away from the door until the auto-calibration is complete.

1. Release the brake with the handle located on the side column and manually move the door to the half-open position.

2. Apply power to the control system. During the system initialization, the display will indicate that the door close and open limits must be set by displaying the associated fault codes; F700 & F762 will scrawl across the display. (See Figure 85)

Then the message Push ● [press reset (●) key] will appear on the display. (See Figure 85)

The door open and close limits are to be set only after verifying that the motor (door) operates in the proper direction when the up (▲) and down (▼) keys are pressed.

3. After the reset (●) key has been pressed one time, verify the motor rotation by briefly pushing the up (▲) and down (▼) keys on the control panel.

The door should open when pushing the up (▲) key and close when pushing the down (▼) key. If the door does not operate in this manner, reverse two of the motor wires (not the incoming three-phase supply wires). Test again as necessary.
4. Now set the door close and open limits according to the instructions on the display.

5. The close limit must be set first, use the down (▼) arrow to position the reversing edge gently on the floor. (See Figure 87) DO NOT drive the edge into the floor. When the proper position is achieved push and hold the Reset (●) until the display reads, “Close limit Set, to open position”.

6. The control will prompt you to set the open position. Use the Open arrow (▲) to position the door in the open position. The open position has a mechanical rubber bumper stop at the top of the door. The open limit should be set slightly below this stop. Hitting the mechanical stop repeatedly could affect the operation of the door. Typical open position is the height of the side column cover, door opening lintel, or just below them. (See Figure 88)

NOTE: If any error messages are displayed, some of the required input connections may be missing. Once the missing inputs are connected, perform the close and open limit set-up. Otherwise, refer to “FAULT CODES” section in the “System 4 Drive & Control” manual.

7. After the limit positions have been established, the door will automatically synchronize. The door controller will automatically prompt you to push the down arrow (▼) button/key & begin the auto-calibration/synchronization process.

During the automatic synchronization process the display will read “I:515, I:510, & I:555” and this is normal. DO NOT make any changes to the door until the “500” type messages have left the screen. This could take up to 15 cycles to complete.

This is done to optimize performance & will allow the door to run smoothly & efficiently.

NOTE: The door will fine-tune the speed setting based on the programmed limits during the first several cycles. The informational messages I:510, I:515, & I:555 will and may appear during the first 10 cycles of the door operation. This is normal, as the controller is optimizing the operational curve of the AC drive & motor. The door may run erratically during this process. DO NOT change any speed or limit parameters during this time.

If the message does not disappear from the display after 15 cycles, contact Rytec Technical Support at 800-628-1909.

8. The Auto-close timers (ACL1, ACL2, etc.) are set to a default of 10 seconds. To modify ACL1 & ACL2 or any other time settings refer to the “SYSTEM PARAMETERS” section in the “System 4 Drive & Control” manual.
**FINAL ADJUSTMENTS**

**SYSTEM RESET**

System Reset – Door reversing Edge

Any time the door is closing and the reversing edge along the bottom bar makes contact with an object, the display will read “F:361” (Edge Tripped) and the door will move to the fully open position. With “F:361” displayed, the door will begin to countdown to close. If the reversing edge is impacted three consecutive times the door will remain open until the system is reset.

1. To reset the control system with “F:361” displayed, first make sure the area directly below the path of the door is clear of all objects and personnel.
2. Then press and hold the reset (●) button until the control reads automatic.
3. Press the door close (▼) button to move the door to fully closed position.

System Reset – Photo Eyes

If either set of photo eyes detects that an object has entered the door opening while the door is closing, the door will reverse direction and move to the fully open position. The door will remain parked in this position until the object has been removed from within the opening. If the front set of photo eyes detects the interruption, the display will read “Photoeye – Fr”. If the rear set of eyes detects the interruption, the display will read “Photoeye – Rr”.

After the door is closed, the display will read “Spiral Door” and the control system will wait for operator input.

Automatic Door Close Time

See “Setting Automatic Delay Timers” section in the “System 4 Drive & Control” manual.

**LEVELING DOOR PANEL**

1. To check a door panel for level, first position the panel so that it is approximately four or five feet off the floor. Then check the bottom edge of the door panel for level. (The panel is considered level when both sides are within ¼ in. of each other.)

   **NOTE:** Do not check the door panel for level by visually observing how it rests on the floor. Level is referenced off the two side columns and the head assembly.

2. Before making any adjustment to the door, remove all electrical power to the control panel.

   **WARNING**

   The disconnect must be in the OFF position and properly locked and tagged before performing the following procedure.

3. Mounted on the bottom corner of the door is an end bracket (one in each corner). This bracket is clamped around the two ends of the drive belt. (See Figure 89)

   **NOTE:** If the door requires adjustment, always lower the high side of the door and never lower the door more than two notches at a time.

4. Secure the door panels with a rope tied from the end bracket to the drive shaft at the head of the door.

5. Loosen the tension trolley at the top of the side column pushing on the black tooth belt. When the trolley is loose push the trolley away from the wall. This will take tension off the belt. (See Figure 90)
Before performing the next step be sure the power is turned OFF. The belt is under tension DO NOT place your hand between the belt and the large pulley in the head assembly. Keep your hand on the smooth side of the belt.

6. Either push on the belt away from the wall toward the large pulley in the console until the belt skips one tooth. Or remove the front plate of the console and access the belt from the front and pull the belt towards you until the belt skips a tooth. As you move the belt towards the pulley a wave will form and travel around the pulley until a tooth is skipped. Continue one tooth at a time until the bottom panel is level. (See Figure 91)

7. Re-apply the tension to the belt with the trolley.

8. Remove the rope from the drive shaft and end bracket.

9. When you confirmed the tension and level panel assembly restore power to the control panel.

10. Cycle the door several times and re-check for level.

TESTING REVERSING EDGE

WARNING

Take precautions to prevent someone else from operating the door as you perform the following procedure. Also, be cautious around the moving parts that are exposed in the side columns.

With the door fully open, press the door close (▼) button. As the door begins to close, test the door reversing edge by hitting the bottom (rubber) edge of the door. (See Figure 92)

The reversing edge sensor is working correctly when the door reverses direction to the fully open position. If the reversing edge is impacted three consecutive times the door will remain open until the system is reset.

1. To reset the control system with "F:361 EDGE TRIPPED" displayed, first make sure the area directly below the path of the door is clear of all objects and personnel.

2. Then press and hold the Reset (●) button until the control reads automatic.

3. Press the door close (▼) button to move the door to the fully closed position.

NOTE: Avoid tripping the photo eye sensors when testing the reversing edge.
CHECKING PHOTO EYES

The photo eyes are provided as a safety feature. If the photo eyes are correctly installed, interrupting either set of eyes as the door is closing will reverse the direction of the door and hold it in the fully open position until the interruption is removed.

Front Side & Rear Side Column Mounted Photo Eyes

The two modules that make up the set of photo eyes each have one indicator light. The eyes are receiving power & are aligned when the indicator on the emitter module (left-front & right-rear eye) is green and the indicator on the receiver module (right-front & left-rear eye) is yellow. If the receiver module indicator light is out, the eyes are not aligned.

The transmitter & receiver can be identified in two ways. The transmitter is designated SMT on the white label or by a single green light that comes on at the clear end of the transmitter. (See Figure 93) The receiver is designated SMR on the white label or by a yellow light that illuminates only when it is in proper alignment with the transmitter. (See Figure 94)

NOTE: When the cable is connected to the photo eye, there is only a ⅛-inch window to see the green or yellow LED light.

1. The photo eyes are internally mounted on the rear of the side column. Check that the photo eye & all connections are secure & there is nothing damaged.

2. Confirm the cable/wires are securely & safely routed as necessary through the side column, across the rear spreader, through the consoles, to the junction box, to the control panel, and correctly wired.

TESTING PHOTO EYE SYSTEM

To prevent injury to personnel or damage to equipment, the photo eye circuit must be thoroughly tested to make sure the photo eye system is operating correctly.

With the power on, the green light on the emitter/transmitter indicates the photo eye modules are powered up. When the yellow light on the receiver modules are also lit, the transmitter & receiver modules are properly aligned.

Placing your hand in front of the side column mounted receiver breaks the light path and should cause the receiver’s yellow light to go out. Removing your hand should cause the light to go back to their original state.

1. With power applied to the control panel and the door in the fully-open position, press the door close (▼) button to activate the door.

2. When the door is about halfway closed, break the beam of light between the front set of eyes only.
The moment the beam of light is interrupted, the control panel should reverse the direction of the door and park it in the fully-open position. When the beam of light is restored, the door should automatically move to the closed position.

**NOTE:** When the front beam of light is interrupted, the display on the control panel will read “Photo Eye – Fr”. When the rear beam of light is interrupted, the display will read “Photo Eye – Rr”.

3. Repeat the above procedure on the rear set(s) of photo eyes.

**VISION PANEL**

Spiral doors with optional window slats have a protective film applied to the Lexan™ window. Remove the protective film when the installation is complete. DO NOT leave the protective film on the window sections after installation.

**Vision Slat - Cleaning**

1. Rinse with flowing water.
2. Clean with warm water and a small amount of mild non-abrasive soap (dish soap).
3. Lightly rinse vision panels using a water spray.
4. Remove excess water using a clean and dry Micro-fiber or lint free cloth. If practical, use a high velocity fan or blower to air dry for best results.
5. Wipe any additional moisture with a dry micro-fiber or lint free cloth. If practical, use a high velocity fan or blower(s) to air dry the panels for best results.

**NOTE:** See Spiral Owner’s Manual for additional information.

**INSTALLING COVERS**

1. Check to make sure the side columns and head assembly have remained plumb, square, and level. Also check that all floor and wall anchors have remained securely fastened.

**HEAD CONSOLES**

2. Install covers to the console assemblies as required. (See Figure 95)
4. Attach the left and right hand side covers. (See Figure 97)

**Figure 97**

### FINAL CHECKS

**NOTE:** Check all the following door components and systems once the door has been cycled at least 20 times.

**Side Columns:** Check that side columns are plumb and square and that all anchor bolts are secure and tight.

**Head Assembly:** Check that all mounting hardware is in place and tight.

**Door Panel Track:** Check the alignment of each door track, particularly where the tracks join up between the side columns and head assembly.

**Covers and Panels:** Check that all covers and panels are in place and securely fastened.

**Motor:** Check that the door travels in the proper direction when the associated buttons are pressed.

**Reversing Edge:** Check that it works properly. As the door is closing, if the reversing edge makes contact with an object, the door should return to the fully open position as described in the “FINAL ADJUSTMENTS – REVERSING EDGE” section on page 32.

**Photo Eyes:** Check that they work properly. As the door is closing, if the light beam between either set of photo eyes is interrupted, the door should return to the fully open position as described in the “FINAL ADJUSTMENTS – PHOTO EYE SYSTEM” section on page 33.

**Spring Packs:** Check that all spring packs are securely fastened to the bottom plate of the side column and the guide brackets secured to the side column sidewall. Also make sure that each nylon spring strap is securely fastened to the clevis bracket at the top of the spring pack.

**Nylon Spring Straps:** Make sure each spring strap is securely fastened to the drive shaft, not twisted, and running true to its respective spring pack.

**Drive Belts:** Check that each drive belt is properly tensioned and that the ends of each belt are securely clamped to the bracket assembly. Ensure that the pulley assembly is level and that the belt runs true.

**Drive Belt Pulleys:** Make sure each pulley bracket is properly secured to the base plate of the side column, head consoles, etc.

**Timers:** Automatic timers must be set to ensure that the door closes properly as described in the System 4 Drive & Control manual.

**Activators:** Check that all the activators operate as specified by the manufacturer.

**Caulk:** Ensure that the side columns and head assembly are caulked where they meet the wall of the building.

**Vision Panel(s):** Check that the protective film from the factory has been removed & that they are clean to allow unobstructed viewing through them as specified by the manufacturer.
